

RURACTIVE

Open Call 1- Technical Proposal

PROPOSAL INFORMATION	
Project Acronym	ANFORA
Project Title	Introducing advanced digital solutions to rural communities for water footprint analysis.
Selected challenge	Challenge 1 - Userfriendly digital platforms for water footprint calculation of agrifood products/diets/recipes
Selected challenge location	Andalucía, Spain

APPLICANT INFORMATION (Full legal names)		COUNTRY
Lead Beneficiary	Evenor-Tech	Spain

Introducing
advanced digital
solutions to rural
communities for
water footprint
analysis.

DISCLAIMER

The RURACTIVE project is Funded by the European Union under G.A No 101084377. Views and opinions expressed are however those of the author(s) only and do not necessarily reflect those of the European Union or European Commission. Neither the European Union nor the granting authority can be held responsible for them.

Summary of the updates made in the proposal

Updates/Changes	Description
Executive summary	Refined to clearly highlight the novelty of the solution, territorial focus, and expected behavioural and environmental impacts. The summary now explicitly connects ANFORA to Challenge 1 of RURACTIVE and emphasises its co-designed, modular, and offline-ready nature.
Objectives	Reformulated using a SMART logic, aligning project objectives with specific KPIs and expected results at each stage. Terminology and indicators were clarified to facilitate easier monitoring and evaluation.
Section 2 (Alignment & Innovation)	Restructured to avoid redundancy and improve logical flow. Innovation is now clearly divided into technical, digital, social, and financial dimensions. The unique use of AI for model selection, offline capabilities, and recipe-level analysis is now fully integrated and justified.
Section 3.1 (Ambition and Barriers)	Strengthened to better explain ANFORA's added value over existing tools, and the barriers were reframed with targeted mitigation strategies. The reasoning behind the TRL progression and social relevance was expanded.
Section 3.2 (Technical Path)	Reorganised for clarity and to reduce repetition. Activities, KPIs, and deliverables were more precisely defined, with a better articulation of stakeholder involvement, user testing, and iterative refinement
Section 3.4 (Data Management)	Fully rewritten to align with GDPR and ethics standards. The role of Evenor as Data Controller is now explicit, and pseudonymisation, encryption, and user consent mechanisms are properly detailed.
Section 4 (Impact)	Rewritten to present impacts through a fluid narrative rather than bullet points. Impact indicators (e.g. 10–15% reduction in water use, 200 users in 2 months, 80% satisfaction) were retained but framed in a more evaluable manner according to the comments received in the face-to-face meeting. Links to behavioural change, environmental policy and long-term sustainability were enhanced.
Section 4.1 (Scalability & Exploitation)	Now includes a clearer hybrid licensing model (open source + commercial), and improved explanation of scaling strategy (modular design, API compatibility, territorial replicability).
Section 4.2 (Longevity)	Expanded with a structured plan for platform maintenance and governance beyond the project period, identifying potential partners and sustainability mechanisms.
Overall	Revised proposal ensures a stronger alignment with evaluation criteria (C1–C4), and improves readability, credibility, and strategic vision without altering the core concept or KPIs outlined in the TP.
Section 3.3 (Visual description)	Pictures have been redesigned to improve the understanding and conceptual design of the project.

1. Overview of the Proposal

1.1. Executive Summary

ANFORA proposes the development and deployment of a **user-friendly digital platform** that enables **rural citizens, farmers, and small agri-food actors** to calculate and understand the **water footprint of agricultural products**, traditional **recipes**, and complete **diets**. Designed with a modular architecture and offline functionality, the tool is specifically tailored to rural communities with limited digital infrastructure, such as those in Lucena (Andalucía), the selected RURACTIVE Dynamo. The solution directly addresses Challenge 1 of the open call, focusing on accessibility, local adaptability, and real behavioural change toward sustainable agri-food consumption.

The platform will be co-designed with end users—including youth, older adults, unemployed individuals, and small-scale producers—ensuring that it is intuitive, culturally relevant, and technically sound. Through **AI-powered recommendations**, ANFORA will dynamically select the most **appropriate water footprint calculation method** (e.g., WFN, ISO 14046, LCA) based on the user's context and available data. Users will also be able to adjust variables and receive feedback on lower-water alternatives, empowering them to make informed decisions. The project will progress from TRL3 to TRL7 over 18 months, with **iterative validation** and **user training** integrated into each development phase. It will incorporate at least five regional or national datasets to ensure local precision, and the platform will be tested with 25 users during the pilot phase, aiming for a **satisfaction rate** above **80%**. By project end, it will reach at least **100 users** and engage **50 participants** in structured training sessions.

Expected outcomes include a **10–15% reduction** in water footprint among early adopters, increased digital literacy, and enhanced awareness of sustainable practices. In the medium term, ANFORA will scale to other rural European territories with similar challenges. The platform's sustainability is ensured through a dual licensing model: open access for individuals and community users, and premium features for enterprises and institutions. **Evenor-Tech**, with its proven experience in **environmental modelling** and **stakeholder engagement**, will lead the project, supported by local networks and public-private partnerships to maintain and expand the platform post-project.

Ultimately, ANFORA represents a high-impact, **scalable solution** that bridges scientific methods with everyday decisions, contributing to water sustainability, food system resilience, and rural empowerment in climate-vulnerable areas.

1.2. Objectives

Project's goal is to **co-design** and **deploy** a **friendly** and **intuitive** web **platform** for **water footprint calculation** for agricultural products, ingredients, recipes and diets in rural areas. This in turns helps to identify practices, approaches and products with more water consume and establish strategies to reduce water consume by using multi-actor approach to ensure continuation of the technical solutions proposed after the Project timespan.

ANFORA project will co-develop user interface and aid adoption of practices that enhance reduce water footprint. ANFORA project level objectives have been designed to be **SMART** (Specific, Measurable, Achievable, Realistic, Time-Bound) and address RURACTIVE open

call. Each **PO** has been achieved in one or more Activities and have one or more key performance indicator(s) (**KPI**) that will be used to measure and verify that the Project is on track to achieving its objectives.

PO1. Define the technical architecture of the water footprint platform based on the end-user needs. [A1.1]. **KPIs:** KPI8 and KPI9.

PO2. Design an intuitive and accessible user interface (UI) based on the functionalities required by end-users. [A1.2]. **KPI:** KPI10.

PO3. Conduct pilot tests with rural users for agriculture, recipes and diets water footprint estimation [A2.1]. **KPI:** KPI14

PO4. Launch the platform online. [A3.1]. **KPI:** KPI16.

PO5. Train rural users on the platform usability in terms of friendly and achievement of end-users' requirements. [A3.2]. **KPI:** KPI17

The proposed monitoring indicators have been verified by the mentoring team to ensure the quality, the impact achieved, and the reliability of the proposed objectives. Furthermore, the team selected to carry out the tasks of the ANFORA project has extensive experience in the co-development of digital tools with end-users, working with multidisciplinary teams, using stakeholder engagement and digital marketing methodologies applied in European research and innovation projects.

KPI nº	Title	Related activity
KPI1	At least 90% objectives and milestones reached in Phase 1	A0.1
KPI2	At least 90% objectives and milestones reached in Phase 2	A0.1
KPI3	At least 90% objectives and milestones reached in Phase 3	A0.1
KPI4	At least 90% objectives and milestones reached in Phase 4	A0.1
KPI5	1 Project website and at least 3 social media profiles	A0.2
KPI6	Project flyer in 3 languages	A0.2
KPI7	Promotional flyer of the tool	A0.2
KPI8	50 interviews conducted	A1.1
KPI9	Between 5-10 products related traditional recipes identified to be included in the list of functional and non-functional requirements	A1.1
KPI10	At least 3 iterations carried out for the validations of the prototype UI.	A1.2
KPI11	Functional module with technical documentation	A1.3
KPI12	Integrations of at least 5 local data sources that allow improving the accuracy of the calculations	A1.3
KPI13	Offline functionality tested successfully on at least 3 device types with a 90% success rate in data sync tests post offline use.	A1.4
KPI14	80-90% satisfaction in the surveys	A2.1
KPI15	Less than 10 critical incidents detected by users.	A2.2
KPI16	100 registered users.	A3.1
KPI17	50 users trained	A3.2
KPI18	Savings 10-15% of water footprint consumption by users.	A4.1
KPI19	Average satisfaction score 4 out 5	A4.1

2. Alignment

2.1. Alignment with the selected RURACTIVE challenge

The ANFORA project directly and strategically addresses Challenge 1 of RURACTIVE—*User-friendly digital platforms for water footprint calculation of agri-food products, diets, and recipes*—with a place-based, inclusive approach tailored to Lucena (Andalucía), a region heavily affected by recurring droughts, irrigation inefficiencies, and climate-induced water scarcity.

Unlike conventional water assessment tools which are often rigid, overly technical, or targeted to researchers, ANFORA proposes an accessible, **co-designed digital platform** that provides **customised water footprint analysis** for three key layers: agricultural products, traditional recipes, and full diets. Its alignment lies not only in the technological solution, **but in the social innovation process**: rural users will actively shape the tool, which is designed to work even offline—a critical feature in low-connectivity areas of Andalucía.

Moreover, the platform will incorporate **locally sourced datasets** and culturally relevant dietary patterns (e.g. traditional Andalusian dishes such as "pisto" or "salmorejo"), ensuring high relevance and usability. The resulting tool will support both **daily individual decisions** (e.g. choosing a recipe with lower water consumption) and **collective awareness** campaigns on water efficiency in rural life.

In this way, ANFORA not only matches the challenge technically but aligns with **the socio-environmental realities of the region**, empowering citizens and small producers with tools they can actually understand and use.

2.2. Rural Development Drivers & Cross-cutting priorities alignment

ANFORA contributes to **three key RURACTIVE Rural Development Drivers (RDDs)** and **addresses all three Cross-cutting Priorities** with targeted and measurable actions.

RDD1: Sustainable Agri-food Systems and Ecosystem Management

- ANFORA promotes responsible water use in local agri-food chains by allowing farmers to assess the water footprint of specific crops and processing steps.
- The tool is adapted to the **agro-climatic and agronomic conditions of Andalucía**, integrating local irrigation practices (e.g. drip irrigation vs. surface irrigation) into the calculation modules as it is reflected in the Activity 1.3.
- It facilitates knowledge-based shifts toward low-water crops and production practices, supported by personalised recommendations.

RDD2: Local Services, Health and Wellbeing

- The platform provides rural populations with a **free, easy-to-use digital service**, improving their **environmental literacy** and supporting healthier diets with a lower water impact.
- Water-conscious diets will also be promoted through **community workshops** and integration of the tool into existing rural advisory networks.

RDD3: Energy Transition and Climate Neutrality

- While the primary focus is on water, ANFORA indirectly contributes to **energy savings** by identifying food production and consumption patterns that demand high energy for irrigation or processing.
- The AI-powered module can incorporate local climate datasets to model future scenarios and offer resilience strategies.

Cross-cutting Priorities

Climate Change Adaptation and Mitigation: ANFORA helps rural actors understand the impact of their dietary and agricultural decisions on local water systems, fostering climate resilience. The tool will offer adaptation suggestions such as switching to low-water crops or seasonal adjustments.

Biodiversity Conservation: By encouraging water-efficient practices and reducing pressure on aquifers, ANFORA supports biodiversity in local ecosystems. The project also aims to **discourage high-footprint monocultures**, promoting traditional and diverse crops.

Social Justice and Inclusion: ANFORA explicitly targets **disadvantaged rural groups**—including unemployed adults, older farmers, and women in agriculture—through a multilingual, mobile-accessible platform and tailored training sessions. The **co-design process** ensures that their needs are embedded in the solution from the start.

2.3. Concept and Innovation

ANFORA introduces a novel, integrated digital solution tailored to rural needs: a **user-friendly, AI-supported platform** that allows citizens, farmers, and small businesses to **calculate the water footprint of agri-food products, recipes, and diets**, adapting to **local data, culture, and context**. Its most distinctive feature is a “**recipe-to-table**” **water footprint simulator**, enabling users to assess and modify food choices or production practices in real time.

For the co-design approach have been identified as potential users the following groups:

Young people under 30	People over 55	Long-term unemployed
Farmers	Agri-food industry	Researchers

While current tools are often too technical, fragmented, or limited to individual products, ANFORA bridges several innovation layers into one seamless experience. Following the innovation layers proposed are described:

Digitally, the platform integrates **AI** to **recommend** the most **suitable methodology** (e.g. WFN, ISO 14046, LCA), while allowing users to override choices. Users can model entire recipes via a **digital twin approach**, adjusting **ingredients** and sourcing to view **real-time water footprint changes**. **Lightweight algorithms** and a responsive interface ensure operability even on low-spec devices in rural settings.

Socially, the platform is **co-designed** with diverse groups—including youth, older adults, and small farmers—to ensure inclusive functionality. Culturally relevant data, such as traditional Andalusian recipes, supports local engagement. **Capacity-building activities** (e.g. training, video tutorials) address digital literacy gaps.

From a **technical** perspective, ANFORA integrates **open datasets** and **user inputs** to reflect local conditions and assigns confidence levels to estimates. Methodologies are modular and adaptable to different granularity levels, from single ingredients to full diets.

Financially, ANFORA applies a dual licensing model—**open** for **citizens** and **premium** for **businesses**—while its modular design ensures easy replication by adapting datasets and

recipes to other regions. These combined innovations position ANFORA as a scalable, inclusive, and impactful tool that operationalises environmental data into everyday decision-making.

Novelty Compared to the State of the Art

Compared to existing tools, ANFORA introduces a significant leap in both functionality and accessibility. Most available water footprint calculators offer generic estimations based on high-level household activities or predefined products, often ignoring the complexities of local agricultural practices, recipe composition, or supply chain variability. Furthermore, these tools are typically designed for expert users or institutional contexts, lacking the adaptability and simplicity required by rural communities. ANFORA breaks this paradigm by enabling personalised, locally adapted water footprint assessments for not only individual products, but also traditional recipes and entire diets. It integrates dynamic data sources, region-specific parameters, and AI-powered methodology selection—while maintaining an intuitive user interface accessible across digital literacy levels. Crucially, it incorporates features rarely found in comparable platforms, such as offline operability, modular expansion to new geographies, and user-driven customization via a “digital twin” approach for food modelling. These combined elements position ANFORA as a novel, inclusive, and scalable solution that translates environmental metrics into meaningful, everyday decisions.

3. Technology Implementation Approach

3.1. Ambition, barriers and impacts

ANFORA addresses one of the most pressing environmental and social challenges in Mediterranean rural territories: enabling citizens, farmers, and small agri-food actors to understand and reduce their **water footprint** through a platform that is **technically robust, locally adapted, and accessible to all digital literacy levels**.

While several scientific methodologies exist to estimate water use—such as **WFN** or **ISO 14046**—these are typically reserved for experts, applied only to narrow contexts, or disconnected from real consumption behaviours. ANFORA bridges that gap by combining **advanced environmental modelling, artificial intelligence, and co-designed user interfaces** into a single, scalable tool that makes water sustainability decisions visible and actionable at all levels—from selecting an ingredient to evaluating an entire diet.

Unlike existing solutions, ANFORA's ambition is not only technological but behavioural: it aims to **democratize environmental data**, enabling rural communities to act based on personalized, localised insights. Users will be empowered to understand trade-offs, simulate recipe changes, compare dietary patterns, and adopt lower-water options—all within an intuitive interface that works online or offline, even in low-connectivity areas.

To ensure transparency and scientific credibility, ANFORA integrates established open water footprint methodologies, selected dynamically depending on the input context (e.g. product, recipe, user type).

| 1. Water Footprint Network (WFN) : Classifies water use into green, blue and grey components. |
|--|

Technical Limitations: Requires detailed data along full supply chains. References: Borgo

(2022)
2. ISO 14046: International standard integrating water impacts into LCA. Technical Limitations: Complex to apply and interpret without expert support. Reference: ISO Standards
3. Life Cycle Assessment (LCA): Evaluates total environmental impact including water. Technical Limitations: Very data-intensive; impractical for small users. Reference: FAO, ISO
4. Water Footprint of Agri-Food Products (WFAP), in Industry (WFI), Personal Water Footprint (PWF), Domestic Sector (WFD), Tourism (WFT) and Energy (WFE): Sector-specific footprints based on food and farming. Technical Limitations: Variability and lack of updated local data. Reference: FAO, Scientific databases.
5. MARIPOSA Project: AI-enhanced carbon and water footprint in fields. Technical Limitations: Focuses only on primary production; not consumer-ready. Reference: Web

Several tools are available for the society to estimate water footprint under different scenarios and situations. However, some of them are not easy to understand or restricted to use:

Individual Ecological Footprint: An application developed by the University of Guadalajara for IOS10 and macOS11.0 or later. This app is aimed at making people aware of the consumption of available natural resources and the waste that is generated or pollutes. This application includes a calculation tool for both carbon footprint and water footprint. Through a simple interface, users can include indirect consumption data, both from activities in their home such as washing clothes or hygiene, as well as indirect consumption from food. The application gives the user an estimation of their water foot print and compares it with the average in Mexico to give recommendations on which sectors they could reduce their consumption. However, the tool does not allow access to water footprints on specific recipes or products or access to available information that may be of interest to the user.

Ecological Footprint: A web application developed by the Rey Juan Carlos University in which the user may obtain a report on the consumption of natural resources on the planet. This report is obtained after a short questionnaire. Although the tool is quite intuitive, it does not provide access to specific data or values. The user only receives a report on whether they are being ecologically responsible or not. The water footprint calculation is based solely on the type of housing, usual food consumption, and reuse or flow reduction systems present in the home.

Watercalculator: Watercalculator.org is a web platform from USA where the user may estimate their water consumption in their home, taking into account the number of people, the energy source, travel, and the type of diet. In addition, it allows generating scenarios so that the user becomes aware of what actions they can modify to reduce their water footprint.

AI for selecting the most reliable water footprint model

To ensure accuracy and reliability, the platform will incorporate an AI-based decision system that enables the automatic selection of the most appropriate water footprint calculation methodology based on the type of product, recipe, or diet being analysed. This selection can be modified by the user if desired, and during the development phase, the methodology selection will be validated by the testers. The AI-powered model will:

- Compare the selected methodologies (such as WFN, ISO 12046, etc.) to determine the most suitable one for the user. However, user will have last word about it.

- Continuously improve its accuracy through machine learning, enabling it to refine its recommendations based on the real-work environment and potential access to new scientific or user data. Always if the user accepted previously the use of data provided to improve results.
- Offer personalised information by adapting calculations to local conditions, ingredient/product sourcing, and agricultural practices.
- Provide users with transparent information about methodology used, aiming to clarify any doubts so they understand how the calculations are performed.

The use of AI in the platform will enable users (general public, farmers, industries, policymakers, etc.) to make more informed decisions and contribute to better water resource management.

Technical Challenges and Solutions

ANFORA embraces complexity but simplifies it for the end user. Below are the key technical barriers identified and how they will be addressed in the platform's architecture:

Multi-source data inconsistency
Description: Water footprint calculations require accurate input across climate, production, and consumption stages—but local datasets are often missing or fragmented.
Technical Response: The platform integrates open-access APIs (FAO, Copernicus, AEMET), crowdsourced inputs, and preloaded regional defaults. AI modules assign confidence levels and offer suggestions to fill gaps.
Methodology selection complexity
Description: Matching the appropriate calculation methodology (e.g. ISO vs WFN) to the user's context is not trivial.
Technical Response: A machine-learning engine automatically selects the most suitable method based on product type, data availability, and user profile. The user may override this selection for transparency.
Recipe-level water modelling
Description: Estimating the footprint of a recipe requires aggregation across ingredients, preparation methods, and sourcing.
Technical Response: A "digital twin" logic allows the user to build or modify a recipe, while the system dynamically recalculates water impacts using both default and user-supplied data.
Offline functionality and data sync
Description: In rural areas, lack of stable internet limits real-time interaction with cloud-based tools.
Technical Response: ANFORA includes an Offline Pack, with local caching of ingredients, recipes, and region-specific data. Syncing mechanisms ensure that once connection resumes, data merges securely with the main platform.
Device and browser limitations
Description: Some users operate on old devices with low processing capacity.
Technical Response: The platform uses lightweight, responsive web design, optimized for mobile use and low-spec systems. Data-heavy processes run on the server-side.
Usability across diverse user profiles
Description: Different stakeholders (e.g. farmers, households, students) have varied expectations, experience, and needs.
Technical Response: UI/UX will be tested iteratively with at least three user segments, and feedback loops will adapt functionality accordingly. Graphical outputs and tooltips improve comprehension.
Minimal number of users engaged

Description: The number reached in the various proposed platform design phases was not representative enough.

Technical Response: Prior work identifying potential users has been carried out. Furthermore, from a technical standpoint, interaction with end-users will be fully adapted to them, and can take place in person, remotely, or in a hybrid manner.

Expected Impacts

Based on the objectives and ambition for the ANFORA project, the following significant impacts are expected:

Short Term: By enabling rural users to assess the water footprint of their food choices—whether agricultural inputs, recipes, or dietary patterns—the platform will empower more informed, sustainable decisions. Initial testing and training activities involving 25 to 50 users in Andalucía will foster local engagement and ensure that the platform meets real user needs. Early users are expected to reduce their water footprint by 10–15%, based on personalised feedback and alternative options provided by the tool. High satisfaction levels (above 80%) will validate both the usability and perceived value of the solution. These results will serve as a foundation for iterative improvement and broader community trust.

Mid-Term: Thanks to its modular architecture and capacity to integrate new datasets, ANFORA can be easily adapted to other rural regions in Europe facing similar water stress and agri-food sustainability challenges. Engagement with local institutions and agricultural networks will support the tool's integration into public water management strategies, digital education programmes, and sustainable food system policies. Additionally, small and medium agri-food enterprises may adopt ANFORA's premium features to monitor water use in their value chains, contributing to internal efficiency and compliance with environmental standards.

Long Term: ANFORA aims to contribute to a broader transformation in the way rural communities and agri-food actors understand and manage water. Through ongoing use and continuous data enrichment, the platform can foster long-lasting behavioural changes—encouraging the adoption of low-water recipes, dietary shifts, and sustainable production methods. Its open architecture and potential for public–private partnerships also position ANFORA as a reference tool for future EU sustainability frameworks. Ultimately, the project's legacy lies in promoting a culture of water-conscious decision-making, enhancing rural resilience, and contributing to biodiversity preservation and climate change mitigation across European landscapes.

3.2. Technical approach and foreseen implementation path

The ANFORA platform will progress from TRL3 (concept validated) to TRL7 (system prototype demonstrated in an operational rural environment), following a structured, user-centred, and technically robust development strategy. This path integrates co-design, agile development, real-world validation, and sustained user training to ensure the solution is not only technologically feasible but also locally accepted and impactful.

Two transversal activities will be active throughout the project to support coordination and visibility:

Activity 0.1. Project Management and Coordination (M1–M18): Regular meetings with mentors (every 45 days), internal biweekly reviews, and four formal deliverables: Mid-term

Report (M3), Final Development Report (10 days post-M6), Mid-term Validation Report, and Final Report (10 days post-M18). **KPI1–4:** ≥90% milestones met in each project phase.

Activity 0.2. Dissemination and Communication (M1–M18): Communication materials including a project website, multilingual flyers, and active profiles on Bluesky, Instagram, Facebook, and LinkedIn. **KPI5–7:** Website and 3 social media profiles (M3), flyer in 3 languages (M4), promotional flyer (M17).

TRL3 – Phase 1: Co-design and Development (M1–M6)

This phase focuses on defining platform specifications and building its foundational components.

Activity 1.1. Platform Co-Design (M1–M3): Through at least 50 interviews across target user groups (youth, older adults, unemployed, farmers, etc.), functional and non-functional requirements will be identified. **KPI8:** 50 interviews conducted. **KPI9:** 5–10 traditional recipes selected.

In order to obtain a representative number of participants, a preliminary list of potential sites to contact them have been identified. The sites have been selected accordingly to respond the most variability and type of users.

Category	Sub-category	Name
Agriculture	Cooperatives	Coop. Lucena with traditional products like Olive Oil and Wine.
	Stores	Agrocor Lucena, Municipality market, Super markets
Food Industry	Olive oil	Almazaras, Olive oil cooperatives (D.O.)
	Meat Products	Celedonio Montilla Embutidos Lucena
	Prepared foods	Precocinados La Alacena
	Wine & Spirits	D.O. Montilla-Moriles
Hospitality	Traditional/Mediterranean	Cervecería Cruz Blanca, Restaurante El Valle, Bodeguita del Casino, Mesón El Chato, Restaurante El Cortijo, La Manzana de Adán
	Coffee shops	Cafetería Los Olivares, Café Bar Andalucía, Bar Kiosko, Caramba, El Recreo

Activity 1.2. UI Development (M2–M4): Wireframes and high-fidelity prototypes will be created using Moqups and Sketch/Adobe XD. At least 3 iterations will be carried out, using tools like Hotjar or Crazy Egg for usability analytics. **KPI10:** Minimum of 3 user-tested iterations.

For that a preliminary questionnaire has been designed which will be circulated to the preliminary list of potential end-users identified as well.

[Questionnaire link](#)

Activity 1.3. Water Footprint Module + Data Integration (M3–M6): This activity will focus on the development of the core computational engine that calculates the water footprint at three levels: individual agri-food products, traditional/local recipes, and full daily or weekly diets. The module will integrate and adapt leading scientific methodologies including:

- Water Footprint Network (WFN): Using the framework by [Hoekstra et al. \(2011\)](#), this method distinguishes between green, blue, and grey water components, and will serve as a base layer for agricultural product estimations.
- ISO 14046 (2014): This internationally recognised standard for water footprint based on life cycle assessment (LCA) will be selectively applied in high-data scenarios, such as industrial food processing cases or institutional diets.

- Simplified LCA-based estimators: Inspired by projects like SU-EATABLE LIFE and OpenLCA, the platform will implement streamlined estimation models suitable for users without technical background, balancing precision and usability.
- Recipe aggregation models: Based on the work of [Saarinen et al. \(2017\)](#), recipes will be modelled as multi-ingredient compositions, allowing the system to dynamically recalculate footprint outputs as users adjust ingredients or quantities.
- Diet-level models: Using principles from the [EAT-Lancet Commission \(2019\)](#), dietary modules will support users in comparing traditional and sustainable diets by integrating water intensity per kilocalorie and per nutrient, adjusted for local consumption patterns.

In addition, the module will incorporate a confidence level indicator that communicates data quality and uncertainty to users, especially when approximations or defaults are used. To ensure full localisation and realism, the platform will integrate a minimum of five regional or national datasets, including but not limited to:

- National or Andalusian agricultural statistics (e.g. from MAPA or Junta de Andalucía)
- Irrigation and hydrological data from local water authorities (e.g. CHG or regional irrigation communities),
- Meteorological records from AEMET, focusing on evapotranspiration and precipitation trends,
- Nutritional composition tables from Spanish or EU health agencies (e.g. BEDCA),
- Regional food consumption surveys or market price datasets from public institutions.

The module will also include a confidence index to communicate the reliability of each estimation based on the precision of available data, encouraging users to reflect critically on results. **KPI11:** Functional calculation module with technical documentation. **KPI12:** Integration of at least 5 local data sources.

Activity 1.4. Offline Functionality (M3–M6): Development of the Offline Pack, with light interface, preloaded datasets, and sync mechanisms. Tests will be run on at least 3 device types. **KPI13:** 90% success in sync tests post offline use.

TRL6 – Phase 2: Testing and Validation (M7–M12)

This phase focuses on field testing, user feedback, and technical optimisation.

Activity 2.1. Pilot Tests (M7–M9): Usability testing with 25–30 rural users in Andalucía, supported by satisfaction surveys. **KPI14:** 80–90% user satisfaction.

Activity 2.2. Platform Optimisation (M9–M12): Based on user feedback, usability and functionality improvements will be applied and monitored using Google Analytics, Hotjar, and Sentry. **KPI15:** Fewer than 10 critical incidents post-launch.

TRL7 – Phase 3: Launch and Training (M13–M18)

ANFORA will reach full deployment and scale in this stage, with sustained outreach and capacity-building efforts.

Activity 3.1. Platform Deployment (M13–M18): Online launch with user registration campaigns via social media, local media, and events. **KPI16:** 100 registered users within two months.

Activity 3.2. User Training (M13–M16): Between 5 and 10 workshops (≤15 people per session) will be conducted, supported by video content for remote access. **KPI17:** 50 users trained.

Phase 4 – Impact Assessment (M17–M18)

Activity 4.1. Evaluation of Impact: Using quantitative (e.g. reduction in water footprint) and **KPI19:** Average satisfaction ≥ 4 out of 5 qualitative (e.g. user satisfaction) metrics. **KPI18:** 10–15% water footprint reduction reported.

3.3. Visual description

Figure 1. ANFORA platform architecture and its 4 modules

Figure 2. ANFORA workflow proposed

3.4. Curation, storage, and security of data

The ANFORA platform will manage a limited set of user-generated data in order to deliver personalised feedback, monitor platform usage, and improve the accuracy of water footprint estimations. While the system is designed to function without collecting any directly identifiable personal data (such as names or contact information), it does process **indirect identifiers** and **behavioural data**, including recipe preferences, product choices, device metadata, and geographic location (when enabled by the user). Therefore, the project fully acknowledges the relevance of data protection and commits to strict adherence to the **General Data Protection Regulation (GDPR – EU 2016/679)**.

All data collected will be subject to **informed consent** procedures. During onboarding, users will be clearly informed of what data is collected, for what purpose, and how it will be stored and processed. Explicit consent will be required to activate optional functionalities such as geo-location or participation in research activities.

In terms of curation and anonymisation, the project adopts a privacy-by-design and privacy-by-default approach. **Data minimisation principles** will guide all technical development choices, ensuring that only the **essential variables** are **captured** and **retained**. Any behavioural or usage data that could indirectly identify a user will be **pseudonymised** or **anonymised** using hashing techniques and removed from raw storage logs. Identifiable metadata such as **IP addresses** or **precise location** coordinates **will not be stored** in their original form. Where appropriate, user data will be aggregated at community or demographic levels to support analytical functions without compromising individual confidentiality.

Data storage and infrastructure security are managed using EU-based cloud services that meet **ISO/IEC 27001 standards** for information security. All data transmissions between users and servers will be protected using **end-to-end encryption protocols**. The system includes role-based access control for administrative operations and scheduled vulnerability assessments throughout the development and validation phases. In cases where the platform is used offline, **data is temporarily stored on the user's device in encrypted form** and automatically purged after a defined period or after successful synchronisation. Under no circumstances will personal or sensitive data be stored permanently on the device.

Governance of data throughout the project lifecycle is overseen by the project coordinator, who assumes the role of **data controller**, while the technical team acts as the data processor under a formal data processing agreement. A **Data Protection Officer (DPO)** will be appointed by the end of the development phase to monitor **GDPR compliance**, address any data-related incidents, and guide ethical implementation. A full **Data Management Plan (DMP)** will be developed and included in the report prepared by month 6 of the project, covering data classification, access rights, retention periods, and deletion policies. Additionally, an internal ethics panel will be established to oversee adherence to ethical principles, and external ethical review will be sought where national requirements demand it. In line with ANFORA's open-access and transparency commitments, non-personal aggregated datasets and metadata generated during the project may be made available through institutional repositories or European open data portals, provided they meet anonymisation standards.

4. Impact

The ANFORA project proposes a novel digital solution that stands out for its accessibility, contextual intelligence, and behavioural orientation. Unlike existing water footprint tools, which often require technical expertise or are limited to narrow scopes, ANFORA delivers a **user-friendly, modular platform** specifically designed for rural users—farmers, citizens, and agri-food micro-enterprises—with diverse digital literacy levels. The interface is fully intuitive and does not require specialised training, ensuring inclusion across different demographic groups. A key innovation is the platform's ability to **personalise calculations based on regional variables** such as soil type, climate, and agricultural practices, while also allowing users to calibrate uncertain inputs manually. This flexibility, combined with the integration of **open datasets** and **artificial intelligence models**, ensures a continuous refinement of estimation accuracy over time. Another critical differentiator is its **offline functionality**. ANFORA provides downloadable installation packs that allow users in low-connectivity areas to perform calculations locally and sync data when a connection becomes available—an essential feature for the digital inclusion of remote rural communities.

These features are expected to generate **tangible short-term impacts**. Users will benefit from actionable insights that enable them to reduce their water footprint by an estimated **10–15%**, whether in agricultural production, industrial processes, or everyday food choices. A structured training programme will engage at least **50 rural participants**, enhancing digital and environmental literacy, while pilot testing will validate the tool with **25 users** and aim for a **user satisfaction rate above 80%**. Upon public release, the platform is expected to register **over 100 users within the first two months**, demonstrating its digital accessibility and public interest.

In the **medium term**, ANFORA's modular and open-source architecture enables its expansion to other European regions with similar agro-climatic characteristics. By simply adapting datasets—products, recipes, and agricultural practices—the tool can scale geographically. Collaborations with public administrations will support its **integration into water management programmes and sustainability certification schemes**, and agri-food companies will be able to adopt it to optimise internal processes, monitor water consumption, and report on sustainability. The platform will also evolve technically through **real-time data integration from IoT devices**, where available, allowing increased accuracy and dynamic feedback loops.

Looking to the **long term**, ANFORA aims to influence both individual behaviour and systemic change. By linking food choices to water sustainability in a locally meaningful way, the platform fosters increased environmental awareness and encourages the **adoption of diets and products with a lower water footprint**. From a financial standpoint, the project foresees a mixed sustainability model: **free access for individuals**, combined with **premium services for companies and institutions**, such as downloadable reports or digital certification tools. This model will help ensure the platform's continuity **beyond the RURACTIVE funding period**, reducing dependency on external grants. Furthermore, by positioning itself as a replicable, open, and technically rigorous solution, ANFORA strengthens European leadership in digital tools for sustainable water use, with clear **potential for international market uptake**.

The **scalability and market potential** of the solution are grounded in three strategic design choices: (1) geographic adaptability through local data integration; (2) open format export and

planned API compatibility to ensure interoperability; and (3) a financial model that combines public good access with optional paid services. These elements together guarantee that ANFORA is not only innovative, but also viable, sustainable, and aligned with the long-term goals of rural digital and ecological transitions.

4.1. Societal Impact and Scaling (Exploitation)

ANFORA has been designed from the outset to be **replicable**, **inclusive**, and **impactful** across diverse rural contexts. By translating complex water footprint methodologies into accessible, localised digital services, the platform responds to a broad spectrum of agricultural, industrial, and domestic needs. Its **modular architecture** and **offline** capability ensure that it can be deployed in other European territories facing water stress, climate challenges, and low digital infrastructure.

Scalability is built into the technical and social fabric of the project. Each new deployment can calibrate calculations using **local crops**, **irrigation methods**, and **dietary patterns**. The system integrates seamlessly with **open data** standards and **APIs**, enhancing its **interoperability** with policy frameworks and environmental monitoring platforms. Multilingual interfaces and inclusive UX design enable its use by people with varying digital skills, including vulnerable groups such as older adults, the unemployed, and smallholders.

The societal impact of ANFORA is multifaceted. It empowers users to make informed choices about food and water consumption, expected to reduce individual **water footprints by 10–15%**. It strengthens environmental literacy through co-design, training, and engagement with rural communities, directly reaching at least **50 users through workshops** and **100 users** in the initial launch. Furthermore, it supports job-relevant skills in sustainability, particularly for younger and underemployed populations.

To secure long-term uptake, the exploitation strategy is based on a tiered model. Individuals and **small producers** will have **open access** to **core functionalities**. Enterprises and institutions may opt for premium services, including advanced analytics, benchmarking, and certification tools. ANFORA will also pursue integration into regional public policy and sustainability programmes in collaboration with local governments and NGOs.

A **hybrid licensing model** will support sustainability: the core platform will be open-source to ensure transparency and adaptability, while commercial licenses will fund the development and maintenance of enhanced features. This approach ensures that the platform remains publicly accessible while generating revenue for ongoing operations and future expansion.

4.2. Project Longevity and Sustainability

The ANFORA project has been designed following a feasible and realistic schedule covering development, testing, deployment, and maintenance of project outcomes. The timeline is structured as follows:

Stage 1: May - June 2025.

Refinement of the initial concept based on feedback gathered during the local workshop.

Stage 2: Development and Deployment (July 2025 – December 2026)

This stage includes **4 phases**:

July – December 2025: Development of the water footprint platform and its proposed modules.

January – June 2026: Prototype testing and validation.

July – December 2026: Final launch of the tool accompanied by training sessions for end-users. Throughout this phase, continuous technical support and follow-up activities will be provided to ensure effective adoption and address any emerging issues.

November – December 2026: Impact Evaluation scheduled at the conclusion of the project, in line with the Agreement.

To sustain the solution's impact throughout the RURACTIVE project, ANFORA will implement ongoing monitoring and support, including refresher training sessions, user engagement activities, and regular updates based on user feedback. This will ensure the tool remains relevant and effective during all project phases.

For long-term viability beyond the project duration, ANFORA has established several sustainability measures to ensure its maintenance at least until June 2027:

1. **Local Support Network:** Establishing regional hubs in collaboration with agricultural cooperatives and local government entities. These partners will play an active role in platform maintenance, promotion, and user support, securing community engagement and ownership.
2. **Integration with Public Policies:** Advocating for the adoption of the platform within regional water management policies to institutionalize its use and ensure policy alignment.
3. **Financial Viability:** Pursuing diversified funding sources such as grants, corporate sponsorships, and exploring service-based revenue models. This financial strategy aims to secure the resources necessary for continuous operation and improvements.
4. **Technology Maintenance and Upgrades:** Committing to regular platform updates, optimization of cloud infrastructure, and enhancement of user experience through gamification and other features. Maintenance will be funded through identified revenue streams and supported by Evenor, which will oversee compliance with regulatory standards and technical upkeep.

5. Implementation, team and budget

5.1. Specific goals for Stage 1 & Stage 2

Table 1. Suggested table for Specific Goals per Stage

Milestone number and name	Description and means of verification
Stage 1: <i>G0.1 Refine original ANFORA idea</i>	Participating in at least 1 local workshop to compile more information about expected outcomes and objectives. MoV: list of attendees.
Stage 2	
<i>G1.1 – Stakeholder Needs Assessment & Functional Requirements</i>	Conduct at least 50 interviews and identify at least 5–10 local traditional recipes. Output: Interview log, requirements document.
<i>G1.2 - Offline Functionality Prototype Developed</i>	A downloadable module with 80% parity with the online version tested by at least 5 rural users. Output: Functionality test report.

<i>G2.1 – Platform Launched and Adoption Initiated</i>	Live deployment of the platform with registration of at least 100 users within 2 months. Output: Platform analytics dashboard.
<i>G2.2 – Community Trained and Engaged</i>	Conduct 5–10 training workshops (max 15 participants per session), reaching at least 50 users. Output: Attendance lists, feedback reports.
<i>G2.3 – Impact Assessed and Results Disseminated</i>	Quantified user-level water savings (10–15%) and average satisfaction score $\geq 4/5$. Output: Final impact report with data analyses.

5.2. Planned activities

Table 2. Suggested table for description of activities

Activity name	Description	Planned outputs	Planned duration
Activity 1.1 – Platform Co-Design	Stakeholder interviews and needs assessment.	Functional and non-functional requirements document; 50+ interviews.	M1–M3
Activity 1.2 – UI Development	Prototyping, wireframes, and iterative testing of UI.	Validated UI after at least 3 iterations; user testing reports.	M2–M4
Activity 1.3 – Water Footprint Calculation Module	Build the core calculator and integrate datasets.	Fully functional module; integration with 5+ local data sources.	M3–M6
Activity 1.4 – Offline Functionality	Develop downloadable pack and test in rural settings.	80% feature parity offline module; tested and documented.	M3–M6
Activity 2.1 – Pilot Tests	Conduct usability and satisfaction testing with real users.	80–90% satisfaction in post-test survey; test report.	M7–M9
Activity 2.2 – Platform Optimisation	Analyse user feedback and refine platform features.	Refined version; <10 critical issues post-launch.	M9–M12
Activity 3.1 – Platform Deployment	Launch and promote the platform publicly.	Live site with 100+ registered users.	M13–M18
Activity 3.2 – User Training	Organize training sessions and distribute video content.	5–10 workshops; training video; 50+ trained users.	M13–M16
Activity 4.1 – Impact Assessment	Evaluate platform use, water savings, and satisfaction.	Impact report with quantified results; final survey analysis.	M17–M18

5.3. Entity / Entities and team

Evenor-Tech: EVENOR is a technology-based company founded in 2009 as a spin-off of the Spanish National Research Council (CSIC). During these 16 years, the company has developed ad-hoc tools for decision-making and evaluation of the territory in numerous areas and territories. Focused on data management and modelling, the company has specialized in the development of advanced algorithms for territory modelling that allow increasing precision and providing information to decision-makers. With a wide range of R&D&I projects behind it, the company has coordinated projects, initiatives and methodologies always taking into account the priorities and needs of the end users. In addition, the company has a social commitment to disseminate the knowledge and developments made as can be seen in its bibliographic references in high-impact scientific journals and in its Digital Marketing and stakeholder engagement strategy.

Name of project or activity

MRV4SOC	Monitoring, Reporting and Verification of Soil Organic Carbon and Greenhouse Gas Balance (2023-2026). Horizon Europe
NOVASOIL	Innovative Soil Health Business Models (2022-2025). Horizon Europe
SteamBioAfrica	Innovative Large-Scale Production of Affordable Clean Burning Solid Biofuel and Water in Southern Africa: transforming bush encroachment from a problem into a secure and sustainable energy source (2021-2024). H2020
CONSOLE	CONtract SOLutions for Effective and lasting delivery of agri-environmental-climate public goods by EU agriculture and forestry (2019-2022). H2020
OPERA	Operationalizing the increase of water use efficiency and resilience (2017-2019). JPI-Water

Type of achievement

Publication	Bravo-García J, Camarillo-Naranjo J, Blanco-Velázquez FJ, González-Peñaloza F, Anaya-Romero M (2024) Mapping the potential habitat suitability and opportunities of bush encroacher species in Southern Africa: a case study of the SteamBioAfrica project. <i>Frontiers of Biogeography</i> 17: e136222. https://doi.org/10.21425/fob.17.136222

Table 3. Suggested table for description of consortia team

Name of Person (EVENOR)	Role in the project and areas of expertise
in	Dr. María Anaya Romero (F)Coordinator. She is an expert on land evaluation and project management with over 20 years of experience research. Part of the development/contributions' catalogue, several ad-hoc tools can be found (WatSat, TERRENVIRON, CarboSOIL, CarboLAND, NOVASOIL Toolbox, etc) related water footprint, water quantity and quality of soils, life cycle assessment, etc. In the context of coordination, she has participated in several European projects under different roles as coordinator, WP leader and partner. Last European projects: DeepHorizon (WP leader), MRV4SOC (partner), NOVASOIL (Coordinator), SteamBioAfrica (WP leader).
in	Dr. Felix González Peñaloza (M) Expert on User Interface and communication. PhD in Soil Science and Physical Geography, with over 20 years of experience in geographic information systems (GIS), remote sensing, and satellite data processing, particularly within the Copernicus program and Sentinel missions. He also possesses strong expertise in statistical analysis and data science, including the application of artificial intelligence to optimize the conservation of soil, water, and natural resources, contributing to European Union-funded projects such as RECARE, CONSOLE, and SteamBioAfrica . He will lead the communication, dissemination and exploitation plan of the project through his experience in other projects as NOVASOIL or DEEPHORIZON.
in	Dr. Francisco José Blanco Velázquez (M). Expert on stakeholder engagement and modelling. Expert in remote sensing and satellite image processing, with over 10 years of experience in geospatial analysis, environmental modelling, and data management using advanced artificial intelligence techniques and geographic information systems (GIS). His expertise in leveraging data from programs such as Copernicus and Sentinel positions him as a leader in land-use change monitoring, ecosystem service analysis, and sustainable natural resource management. He has participated in and led high-impact projects at both national and international levels (MRV4SOC, DeepHorizon, NOVASOIL, BIOLIVAR, CONSOLE, OPERA, etc).
in	MsC. Javier Bravo García (M). Expert on Water Footprint. PhD student from EVENOR (Dr. María Anaya-Romero is his thesis director) in Physical Geography and Territorial Analysis with a solid academic background in biology and a master's degree in Climate Change, Carbon, and Water Resources. He has practical experience in creating and use water footprint calculators and modelling and data integration by leveraging Google Earth Engine, Python, and Sentinel-2 satellite data. He currently works at Evenor-Tech, where he has participated in international projects such as SteamBioAfrica, MRV4SOC, and NOVASOIL, focused on the sustainable management of natural resources and biodiversity.
in	MsC. Fernando Alonso Martín (M). Expert on Digital Solutions. PhD student in Geospatial Data and a software engineer with expertise in computer engineering and a master's in Big Data, Cloud, and IT Management. He specializes in developing web applications, geospatial tools, and remote sensing methodologies, with strong skills in Python, JavaScript, Java, and SQL. At Evenor-Tech, he has contributed to international

projects like SteamBioAfrica, NOVASOIL, and DeepHorizon, focusing on sustainable resource management and geospatial innovations.

M (Male), F (Female), O (Other)

5.4. High Level Budget

Table 4. Suggested table for description project costs

Cost category	Total	Description
[A] Direct personnel costs	42500	A total of 5.45 PMs are expected distributed in the following phases: PH1 (2.25), PH (2.5), PH3 (0.3) and PH4 (0.4)
[B] Travel costs	1500	1 person, 10 training events (150€ per travel by car)
[C] Equipment costs		
[D] Other direct costs		
[E] Indirect costs ¹	11000	
TOTAL PROJECT COSTS²	55000	

5.5. Risk assessment

Table 5. Suggested table for risk assessment

Risk	Level (low, medium, high)	Mitigation Plan
User Adoption Resistance	Medium	Conduce user training, ensure intuitive UI, and implement feedback loops for improvements.
Data Availability and Accuracy	Medium	Integrate multiple data sources, validate datasets with experts, and allow user-generated data to refine accuracy.
Technical Challenges (Offline Mode & AI Integration)	High	Develop lightweight algorithms, optimise caching mechanisms, and conduct thorough testing in rural connectivity scenarios.
Financial sustainability Post-Project	Medium	Implement a mixed funding model, including premium services for business and partnerships with government organisations.
Regulatory Compliance (GDPR & Data Protection)	Medium	Ensure encryption, anonymization, and user content mechanisms. Conduct regular audits for compliance.
Scalability to other regions	Low	Develop a modular system allowing easy adaptation of data inputs and methodologies for different geographic contexts.

¹ Must be calculated as $(A+B+C+D)*0.25$

² Must not exceed € 55,000 (Single Entity) and € 85,000 (Consortium)

6. ETHICS & SECURITY

This section is NOT covered by the page limit.

Please fill the ethics/security check list. Provide yes/no answer for each item.

6.1. Ethics/ Security Checklist

	YES/NO
Informed consent	
Does the proposal involve children?	NO
Does the proposal involve patients or persons not able to give consent?	NO
Does the proposal involve adult healthy volunteers?	NO
Does the proposal involve Human Genetic Material?	NO
Does the proposal involve Human biological samples?	NO
Does the proposal involve Human data collection?	NO
Research on human embryo/foetus	
Does the proposal involve Human Embryos?	NO
Does the proposal involve Human Foetal Tissue / Cells?	NO
Does the proposal involve Human Embryonic Stem Cells?	NO
Privacy	
Does the proposal involve processing of genetic information or personal data (e.g., health, sexual lifestyle, ethnicity, political opinion, religious or philosophical conviction)	NO
Does the proposal involve tracking the location or observation of people?	NO
Research on animals	
Does the proposal involve research on animals?	NO
Are those animals transgenic small laboratory animals?	NO
Are those animals transgenic farm animals?	NO
Are those animals cloned farm animals?	NO
Are those animals nonhuman primates?	NO
Research involving developing countries	
Use of local resources (genetic, animal, plant etc)	NO
Benefit to local community (capacity building i.e., access to healthcare, education etc)	NO
Dual use	
Research having direct military application	NO
Research having the potential for terrorist abuse	NO
ICT implants	
Does the proposal involve clinical trials of ICT implants?	NO
I CONFIRM THAT NONE OF THE ABOVE ISSUES APPLY TO MY PROPOSAL	

6.2. Ethics

If you have entered any ethics issues in the Ethics/ Security checklist, you must:

- Submit an ethics self-assessment, which:
 - Provides a rationale for the option made.
 - Describes how the proposal meets the national legal and ethical requirements of the country or countries where the tasks raising ethical issues are to be carried out.
 - Explains in detail how you intend to address the issues in the ethical issues table, as regards:
 - Research objectives (e.g., study of vulnerable populations, dual use, etc.).
 - Research methodology (e.g., clinical trials, involvement of children and related consent procedures, protection of any data collected, etc.).
 - The potential impact of the research (e.g., dual use issues, environmental damage, stigmatisation of particular social groups, political or financial retaliation, benefit-sharing, malevolent use, etc.).
- Provide the documents that you need under national law (if you already have them), e.g.:
 - An ethics committee opinion.
 - The document notifying activities raising ethical issues or authorising such activities.

 If these documents are not in English, you must also submit an English summary of them (containing, if available, the conclusions of the committee or authority concerned).

 If you plan to request these documents specifically for the project you are proposing, your request must contain an explicit reference to the project title.

6.3. Security

Please indicate if your project will involve:

- Activities or results raising security issues: [NO]
- 'EU-classified information' as background or results: [NO]
- Any potential "dual use" of results: [NO]
